

Advice on Buying a Home Log Cabin

The cost of log cabins varies greatly depending on the kinds of logs which have been used and the size of the property. You will find that those cabins that have been built using handcrafted logs will cost much more than those where the logs have been milled.

Therefore, before you actually go ahead and get a cabin built from logs it is crucial that you actually know what the difference is between milled and handcrafted logs. Those that have been milled will have been placed through a sawmill, lathe or planer. This will ensure that they all come out in the same uniform size, shape and have the same profile.

In addition, what you will often find that milled log cabins are ones where the wood has been either air or kiln dried. This enables the right amount of moisture to be extracted from the wood before they are used to build a home with.

Because the wood will have been either planed, sawn or lathed the surface of the logs will be smooth. Plus in many cases, they will also have a tongue and groove joints so actually putting the logs together is much easier. This means that building the cabin is a lot easier and will often take a lot less time to complete. However, if you want to retain that rustic look to your cabin the outer face of the log can retain its rough bark coating.

Generally, the wood that is used for milled log cabins comes from trees such as cedars, pines or spruces as well as firs. The least expensive type of milled log cabin is one that has been made using either pine or spruce. Whereas if you are willing to pay more then the option is to go for one made from cedar.

Now let us look at a cabin that is made using handcrafted logs. These will have been prepared by either being hand peeled with a drawknife or water peeled. The logs used are only a matter of days or weeks old after being cut down so will still be green. Because of the size of the logs this ones are usually allowed to dry in the air as kiln drying is a very expensive process. Also there are not many kilns are available that these sizes of logs would be able to fit into.

Just like with milled log cabins those who make handcrafted ones like to use pine and spruce trees. However, there are some log cabin manufacturers who prefer to use either Douglas fir, Oak, Juniper, Cyprus or Alpine Fir (True Firs) instead.

As mentioned the cost you pay for buying and having log cabins constructed will not only depend on the way in which the logs have been prepared. You also need to take into consideration the size of the cabin you are having built. The bigger the cabin then the more labour intensive and the more logs will be needed in order to build it. If you want to save money but would like a large cabin then you are better off going for milled rather than handcrafted logs.

About the Author

There are a variety of [log cabins](#) available to purchase online which can add something special to your garden. You could also consider choosing from the variety of [summerhouses](#) which are very similar to log cabins.
